

Study program: Electrical and Computing Engineering – Module: Remote Control				
Type and level of studies: Master studies (second level of studies)				
Course unit: Advanced Signal Processing				
Teacher in charge: Uroš Pešović, Radojka Krneta				
Language of instruction: English				
ECTS: 6				
Prerequisites: -				
Semester: Winter				
Course unit objective				
<ul style="list-style-type: none"> – knowledge of advanced signal processing techniques (spectral estimation and prediction, adaptive filtering) and their use in modern control systems – using a combination of theory and software implementations to solve signal processing problems – gaining skills for using mathematic and software tools, such as Matlab an LabView, for solving the problems. 				
Learning outcomes of Course unit				
After the course, each student is expected to be able to:				
<ul style="list-style-type: none"> • describe and analyze discrete time stationary stochastic signals, in terms of their autocorrelation sequence and spectral density, and to determine how these properties are affected by linear filtering. • know how to perform sampling and reconstruction and describe how these operations affect both deterministic and stochastic signals, in the time and frequency domain. • estimate the spectral density of a signal, based on a limited number of noise samples, especially: <ul style="list-style-type: none"> – implement and use non-parametric methods for spectral estimation – implement and use parametric methods for spectral estimation, – estimate parameters in the models, using MMSE and least squares methods. – use the models with the estimated parameters in applications such as spectral estimation and prediction. • know how to perform image processing • use a combination of theory and software implementations to solve signal processing problems 				
Course unit contents				
Theoretical classes				
1. A/D and D/A conversions, correlation and convolution, spectral analysis with DFT and FFT, use of Laplace and z-transforms in system analysis and design, filter design and quantization and round-off effects).				
2. Theory of spectral estimation and prediction.				
3. Adaptive filtering (Least-Mean-Square Algorithm, Frequency-Domain Adaptive Filters, Recursive Least-Squares Algorithm, Tracking of Time-Varying Systems).				
Practical classes				
Laboratory and computer sessions, web discussions via forum and e-mail, case study

Number of active teaching hours				
Lectures: 2	<i>Practice: 2</i>	<i>Other forms of classes:</i> Mentoring system	<i>Independent work:</i> Case study	Other classes
Teaching methods: consultations, independent individual work				
Examination methods (maximum 100 points)				
Exam prerequisites	No. of points:	Final exam	No. of points:	
Student's activity during lectures	5	oral examination		
Practical classes	20	written examination	55	
Seminars/homework	20		
Project				
Grading system				
Grade	No. of points	Description		
10	91-100	Excellent		
9	81-90	Exceptionally good		
8	71-80	Very good		

7	61-70	Good
6	51-60	Passing
5	less than 50	Failing
