

Study program : Mathematics			
Type and level of studies: Master academic studies			
Course unit: Numerical Analysis 2			
Teacher in charge : dr Tatjana Tomović, Assistant Professor			
Language of instruction: English			
ECTS: 10			
Prerequisites: Numerical Mathematics, Numerical Analysis 1			
Semester: <i>Summer Semester</i>			
Course unit objective			
The course offers an introduction to numerical solutions to ordinary differential equations, elliptic, hyperbolic and parabolic partial differential equations and integral equations.			
Learning outcomes of Course unit			
The student will obtain a solid introduction to the theory of numerical methods for ordinary differential equations, partial differential equations and integral equations (with derivations of the methods and some proofs). They will learn to implement the computational methods efficiently in Mathematica.			
Course unit contents			
<i>Theoretical classes</i>			
Ordinary differential equations (boundary problems) Shooting method. Finite Difference Method. Finite Element Methods. Ritz method. Galerkin method. Collocation.			
Partial differential equations Classification of PDEs. Numerical solution of partial elliptic, hyperbolic and parabolic equations. Finite Difference method.			
Integral equations The Numerical Solution of Fredholm integral equations. Determinant method. Successive kernels method. Degenerate kernels.			
<i>Practical classes</i>			
The application of theoretical knowledge to solve problems. Implementation of the computational methods in Mathematica.

Grading system			
Grade	No. of points	Description	
10	91-100	Excellent	

9	81-90	Exceptionally good
8	71-80	Very good
7	61-70	Good
6	51-60	Passing
5	0-50	Failing
